Chapter NLP:VI

VI. Syntax

- Grammar Formalisms
- □ Phrase Structure Grammars
- Dependency Grammars

Problem: Given a set of symbols, how do they incur meaning?

Sun, Leipzig, the, shine, warm, in

- Leipzig shone warm in the sun.
- □ In Leipzig warm the sun is shining.
- Warm is the shining sun.
- □ The sun shines in Leipzig.

Problem: Given a set of symbols, how do they incur meaning?

```
Sun, Leipzig, the, shine, warm, in
```

- Leipzig shone warm in the sun.
- In Leipzig warm the sun is shining.
- Warm is the shining sun.
- The sun shines in Leipzig.

Definition 1 (Grammar [Saussure])

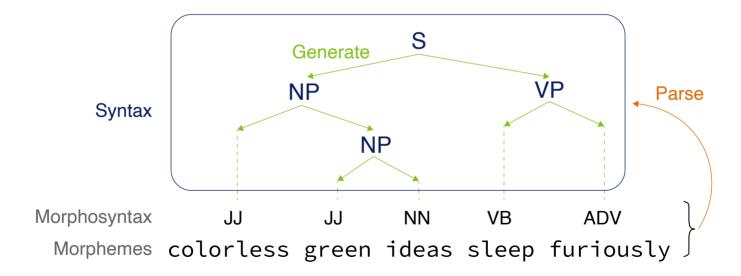

A grammar is a system that describes the relationship between concepts (signified, *langue*) and expressions (signifier, *parole*).

Grammars

Definition 2 (Grammar [Chomsky])

A (generative) grammar of a language is a device that parses and generates all grammatical sentences of a language and rejects ungrammatical ones.

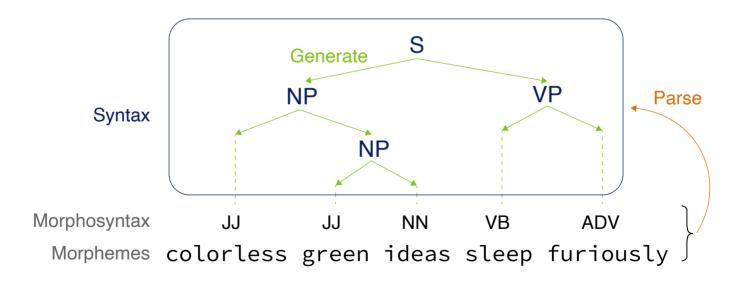

- 1. Parse: Determine the syntactic structure of a given sequence of symbols.
- 2. Generate: Produce valid sequence of symbols given a set of structural rules.

Grammars

Grammaticality is usually understood as intuitively acceptable to a native speaker. A grammatical sentence does **not** need to:

- have ever been observed in a corpus,
- □ be statistically probable, or
- be meaningful.

Remarks:

- ☐ There are different ways of thinking about grammar, based on the underlying theory of language. Computer scientists prefer the formalist perspective.
 - Formalist: Grammar is a system of rules (a formal, generative model) that describe if a sentence is grammatical.
 - Functional: Grammar describes how utterances are constructed to serve a function in disourse.

Discourse Act (Intent, Speaker, Adressee) \rightarrow Semantics \rightarrow Morphosyntax \rightarrow Phonlogy

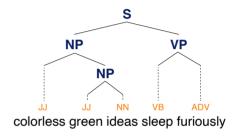

- Chomsky's proposed model of grammar is called 'generative transformational grammar'. It subsumes phrase structure, transformational, and morphophonemic rules. The first is determines the syntactic structure of a string, the latter two transform a string, given his phrase structure, into phonetic morphemes, a representation of the spoken sentence.
- ☐ The generative aspect of Chomsky's theories is widely adapted and different models develop the idea further. The transformational aspect is controverial.

Syntax Structures

The syntax structure of a clause is hierarchial and modeled as either:

Phrase Structure Grammar (top-down):

- Clauses and phrases are divided into one or many constituents.
- Top-level constituents are often Subject/Noun Phrase (NP) and Predicate/Verb Phrase (VP).
- The leaves are always words.

Dependency Grammar (bottom-up):

- Each morpheme has one head node in the syntax structure and zero or many dependents.
- The root node is usually the main verb.

Syntax Parsing

Determining the syntax structure automatically is used for:

- Grammar checkers
- Complex named entity recognition (e.g., in biological or legal domains).
- Entity relation extraction
- Syntax-based sentence compression
- Mining of opinions on aspects of products
- Source-sentence analysis for machine translation
- High precision question answering

Ambiguity

Every sentence can have several grammatical syntax structures due to structural ambiguity. Common forms are attachment ambiguity and coordination ambiguity.

Attachment ambiguity:

□ The attachment of many constituents (prepositional phrases, adverbial phrases, infinitives, . . .) is ambiguous:

```
The board approved its acquisition \rightarrow attaches to "approved" \rightarrow attaches to "its acquisition" \rightarrow attaches to "its acquisition" \rightarrow attaches to "by Royal Trustco Ltd." \rightarrow attaches to "by Royal Trustco Ltd." \rightarrow attaches to "its acquisition" \rightarrow attaches to "its acquisition" \rightarrow attaches to "approved ... for $27 a share"
```

□ Number of potential attachments grows exponentially with the number n of constituents according to the Catalan numbers:

$$C_n = \frac{(2n)!}{(n+1)! \cdot n!}$$

Ambiguity

Every sentence can have several grammatical syntax structures due to structural ambiguity. Common forms are attachment ambiguity and coordination ambiguity.

Coordination ambiguity:

□ It is often unclear which phrase is coordinated by a conjunction:

```
[[old] [man and woman]] VS. [old man] and [woman]
```

Ambiguity

Every sentence can have several grammatical syntax structures due to structural ambiguity. Common forms are attachment ambiguity and coordination ambiguity.

Syntactic disambiguation:

- Many parses are grammatical.
- Few parses are semantically plausible:

```
Scientists observe [whales] [from space]. VS.
Scientists observe [whales from space].
```

 Parsers should chose one, the most probable parse. This is called syntactic disambiguation.
